Sites Notification  
Chicago, Illinois 60604

Gentlemen:

Please take note of the changes we've made in our site notification forms. After re-evaluating the situation and checking what few records remain, we felt it necessary to notify you of the following changes.

- 1) We are eliminating F004 from the waste type listing. Clayton Chemical has never handled cresols or cresylic acid.
- 2) We are listing SCA as a general site. SCA has three disposal sites in the St. Louis area which we notified you of originally. In fact, SCA hauled waste from our plant to one or more of their sites, but we cannot verify which site or the quantities delivered.
- 3) Dates of waste handling was changed for Mid-States Disposal. 1980 was the last year Mid-States was utilized by Clayton Chemical.
- 4) Under Known, Suspected, or Likely releases to the environment, we have entered a question mark for Sauget and SCA. No releases have occurred to our knowledge. We do not monitor these sites. We are privy to monitoring information at Mid-States.
- 5) Volumes of wastes have been presented on a dry volume basis for the Sauget, Mid-States, and SCA (in general) sites.

RECEIVED

AUG 10 1982

-2-

In order to keep our still bottoms (waste from solvent recovery) liquid and pumpable, approximately 50% water was added to the waste stream. Therefore, the new volumes are presented on a dry volume basis to indicate the amount of hazardous components landfilled.

Please attach these updated notification forms to the originals.

Sincerely,

A handwritten signature in cursive script that reads "Dave Wieties".
